This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A multi-parameters model associated with waviness defect and material properties is developed and formulated.
- The three-dimensional stiffness parameters of wavy composite laminates are investigated systematically.
- The negative in-plane Poisson's ratio is found for CFRP with ply waviness, which provides a possible, new technique to design the auxetic materials.
- The effects of waviness defect on composite laminates are determined quantitatively.
