Investigation on the optimal cooling tower input capacity of a cooling tower assisted ground source heat pump system

Xuemei Gong , Lei Xia , Zhenjun Ma , Guangming Chen , Lili Wei

PII: S0378-7788(18)30903-4
DOI: [10.1016/j.enbuild.2018.06.024](https://doi.org/10.1016/j.enbuild.2018.06.024)
Reference: ENB 8626

To appear in: *Energy & Buildings*

Received date: 20 March 2018
Revised date: 14 May 2018
Accepted date: 14 June 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The performance of a cooling tower assisted GSHP was investigated
- Experimental platform and simulation model of the HGSHP were developed
- Soil heat accumulation could be greatly alleviated when CTICR was greater than 50%
- The optimal cooling tower input capacity and control strategy were identified
