This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Wavelet transform, SVM and PLS are used for building the load forecast model.
- Sensitivity analysis and correlation analysis are used to select the input variables.
- The significant meteorological factors to cooling and heating load are obtained.
- Dynamic load predictions for different time horizons are evaluated.
