This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Understanding the human-building interactions in residential buildings has a high potential of energy saving.
- Monitoring occupant behaviour in residential buildings presented challenges referring to movements between spaces, diversity of activities and, privacy issues.
- Mixed-mode methods for monitoring occupant behaviour provided explanatory variables and allowed triangulation of monitoring results.
- Occupancy and interactions with building devices are highly dependent on time, which was explored by stochastic modelling methods.
- Occupant behaviour models provide the possibility to evaluate accurate scenarios for human-building interaction in order to enhance building energy performance.
