This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Cost effective solutions for energy retrofitting projects are of capital importance for owners, especially for public or semi-public real estate companies who are dealing with large housing stocks.
- The aim of the present research work is to make a proposal for a DSS to help identifying the optimal intervention strategy for the energy retrofitting of public housing stocks.
- The proposed DSS evaluates the economic sustainability of various design alternatives with the net present value (NPV) and the global cost (GC), as suggested by the EPBD recast EU directive. These indicators are compared with the building energy performance index (EP).
- For energy and cost calculations all the required data of the DSS are implemented into a novel tool called BQE (Building Quality Evaluator), which can produce the requested results
