Abstract

Converting the CO₂ gas *via* catalytic methanation technology has significant potential application in the power plant industry. Therefore, ceria based catalyst impregnated with Ru/Mn/Al₂O₃ was developed and from the experimental results, the optimum conditions over potential Ru/Mn/Ce(5:30:65)/Al₂O₃ catalyst was achieved with 65 wt% of Ce based loading calcined at 1000°C gave 97.73% of CO₂ conversion with 91.31% of CH₄ at 200°C of reaction temperature. 10 g of the potential catalyst was pre-reduced at 300°C for 30 minutes in the presence of H₂ gas prior to the start of catalytic testing. The reliability, robustness, reproducibility and regeneration testing of this catalyst were further studied. The catalyst started to deactivate (spent catalyst) at sixth testing with only gave 41.17% CO₂ conversion. However, the catalyst can be regenerated in the presence of compressed air at 400°C for 3 hours as it gave 92.85% of CO₂ conversion. From the characterization of spent catalyst, the factor for the catalyst deactivation in this reaction was the particle agglomeration due to the loss of RuO₂ and Mn₂O₃ species. When the catalyst was scale-up, the result showed that Ru/Mn/Ce(5:30:65)/Al₂O₃ catalyst able to convert 60% of CO₂ and 50.4% of methane formation at lower reaction temperature of 160°C.

Keywords: methanation, scale-up, flue gases, carbon dioxide, catalyst, ceria
