This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- A new methodology was introduced to evaluate offshore wind potential
- Geographical Information System (GIS) based multi-criteria decision analysis (MCDA) was used as the basis of the methodology
- The methodology was applied on offshore areas around Egypt
- Three sites with high wind energy potential were identified with electricity capacity of approximately 33 GW which will more than double the current installed capacity of Egypt.
