This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- PV power is always associated with uncertainties due to solar irradiation & other weather parameters intermittency.
- A hybrid Wavelet-PSO-SVM forecasting model based on SCADA and Meteorological information is proposed.
- Daily average MAPE of 4.22% and NMAE of 0.4% have been obtained by the proposed model.
- The proposed model has resulted in outperformed accuracy as compared to other seven forecasting models, while the average computation time is lower than 15 seconds.
