This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Experimentally verifies a coaxial heat exchanger simulation with laminar outer flow.
- Experimental results are used to investigate short-term heat exchanger behavior.
- A semi-analytical model is found to successfully model the laminar flow condition.
- Compares long-term performance and required length using a semi-analytical model.
- Findings show that a larger inner pipe diameter is beneficial for the tested cases.
