This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

# A Multiagent based Decentralized Energy Management System for Power Exchange Minimization in Microgrid Cluster

**Short title:** Energy management for Microgrids

**Number of References:** 35

## Highlights

- A decentralized energy management system is developed for power dispatch for a single Microgrid and Microgrid cluster
- The energy management system was developed through a multiagent platform in order to minimize power exchange with the grid
- The decentralized energy management system has proven its reliability and effectiveness in normal operation as well as in an event of failure through JADE and Simulink simulations

## Abstract

Energy management system (EMS) is one of the pillars of next generation of power system called Smart Grid. More distributed generation (DG) produced from renewable energy (RE) will be injected into the distribution power system. EMS has the responsibility to manage this RE generation and conventional one to keep the power balance between generation and consumption. Different architectures of EMS could be found in literature: the centralized, decentralized and distributed. As the centralized architecture is becoming outdated, the decentralized one is the most promising step before implementing a fully distributed system. In this context, development of multiagent systems (MAS) and their tested proprieties increase researchers' interest in applying them in Microgrid (MG) context.
