This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- Successful treatment of depression is complicated by heterogeneity in symptoms, severity, and course of the disorder.
- Latent class analysis (LCA), which can discern patterns from many depression characteristics, has been used to identify depression subtypes for many years but results have been inconsistent.
- Depression subtypes resulting from LCA models are most often distinguished by depression severity, with domains such as functioning and neurobiological measures rarely considered.
- The utility of depression subtypes resulting from LCA could be improved through standards for conducting and interpreting LCA models.
