This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- This is the first psychometric study evaluating an alternative scoring method for the QIDS-SR<sub>16</sub>.
- Alternative scoring consisted on summing all scorable items (i.e., 14) instead of the 9 symptom domains.
- Exploratory factor analysis supported the unidimensionality of the scale.
- QIDS-SR<sub>16</sub>'s internal consistency reliability and convergent validity were not compromised.
