This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Melancholic unipolar depression may have lower odds of remission to antidepressants
- A higher differential response rate drug/placebo could be observed in melancholia
- Patients with melancholia could achieve better outcome with tricyclic antidepressants
- Due to scarce data available and other limitations the results are preliminary
