This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Individuals at ultra-high risk (UHR) for psychosis are less likely to rely on active coping and more likely to rely on passive coping.
- Aberrant attribution style of the hostility perception and composite blaming bias in UHR for psychosis are associated with problem-focused coping and tension-reduction, respectively.
- Perceived social support in UHR for psychosis is associated with problem-focused coping, seeking social support, and wishful thinking.
- General self-efficacy in UHR for psychosis is primarily related to problem-focused coping.
