This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

The Growth of Mathematics and Reading Skills in Segregated and Diverse Schools: An Opportunity-
Propensity Analysis of a National Database

James P. Byrnes and Dana Miller-Cotto

Temple University

Running head: Diversity, Opportunity, and Propensity

Resubmission date: February 12, 2016

Highlights:

- Elementary and Middle Schools in the United States remain as racially segregated as they were when the Landmark Brown versus Board of Education Supreme Court Decision was made in 1954
- In this study, schools that vary in their diversity differed significantly in terms of a variety of predictors (e.g., SES, teacher experience and instructional style, classroom misbehaviors, student motivation, negative affect, etc.), and these predictors collectively explained approximately 50% of the variance in growth curves within four HLM analyses.
- However, school diversity still predicted variance in growth curves even after controlling for these variables
- Differences also emerged across models for reading and math, and across models for 3rd graders and 8th graders; these differences require additional study and theoretical analysis
