This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## HIGHLIGHTS

- Z-standardizing test scores has consequences for regression inference.
- Coefficients cannot necessarily be compared across different samples in this case.
- I call this lack of comparability the self-reference problem.
- The problem stems from differences in sample composition.
- I outline several ways to compare regression results that use different samples.
