This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Feature Selection of topology parameters to support optical network design systems
- New mutual information via entropy estimation to filter the most important parameters
- Real-world and random-generated optical networks are under study
- Some parameters related to congestion, connectivity, distance, and degree stand out
- Wavelengths use, an NP-hard metric, explained by polynomial computation time features
