This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

1

Highlights

- An over-dimensioning model for planning robust industrial wireless local area networks considering
 3D obstacle shadowing effects
- An efficient genetic algorithm (GA) is proposed to solve this model even at a hyper-large scale
- A greedy heuristic and a random placement algorithm are introduced as benchmarks
- This model and GA are both experimentally validated and numerically demonstrated
