This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We present a medical diagnosis decision support model for gastrointestinal cancer.
- The model uses case-based reasoning (CBR) and rule-based reasoning (RBR).
- We used real patient data as inputs to our model.
- The model was validated through K-fold cross validation and the paired t-test.
- Improved diagnosis accuracy compared to a CBR approach not using RBR in retrieval.
