This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A sensory substitution algorithm based on a liquid sound model is proposed
- The algorithm is tested in a blind wayfinding experiment with 14 participants
- Results indicate superior navigation accuracy compared to the vOICe algorithm
- The delivered sounds are positively rated as intuitive and pleasant
- The results should be applied to the visually impaired population with caution
