This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- A sparse framework-based encoding model is proposed to build an invertible mapping.
- The proposed Gabor-like feature can obviously improve the accuracy of the model.
- The invertible mapping can be used to accomplish both encoding and decoding tasks.
- Based on the mapping, a hybrid image identification method is proposed.
