Abstract

In this paper, a novel controller is proposed to reach tracking synchronization in task space for networked redundant manipulators in circumstance of unknown system parameters, disturbance and sub-task requirements. We notice that the initial neural weights of neural network controller in existing literatures are sloppily selected which may have influence on tracking performance. In the proposed controller, a universal method is proposed to carefully assign the initial neural weights that are commonly close to the ideal values, and consequently the tracking performance can be improved. Meanwhile, input dimension of neural network is reduced and approximability of neural network is ensured. Simulations are given to show the effectiveness of the proposed controller.

Keywords: Adaptive control, Neural network, Redundant manipulator, Networked Lagrange system

1. Introduction

Control of manipulators has been a hot research spot due to the increasing usage of manipulators in many industrial fields. Coordinated control of redundant manipulators receives particular attention because end effectors are often required to track a given trajectory in task space in industrial applications, such as spraying, welding and slicing, and the redundant joint provides the possibility of completing multi-tasks simultaneously, such as
