## Abstract

Semi-supervised learning has received extensive attention in computer vision and machine learning community due to its applications in object detection and image classification. However, most existing multi-label semi-supervised learning methods artificially construct the category graph. This reduces the flexibility of algorithms. Moreover, it is difficult to select appropriate parameters due to the complex distribution of data in real applications especially when there are few labeled samples. To handle this problem, in this paper, we propose a novel nuclear-norm based semi-supervised learning framework for multi-label classification. To be specific, we employ nuclear-norm regularization for class-level smoothness to adaptively construct category graph in the criterion function. Thus, it effectively improves the classification performance. In addition, a non-greedy iterative algorithm is introduced to solve the criterion function, which has good convergence. Furthermore, based on the proposed framework, two novel nuclear-norm based algorithms are developed. Extensive experiments on three real-world datasets illustrate that our proposed method achieves better performance than some state-of-the-art multi-label learning algorithms.

*Keywords:* semi-supervised, multi-label, nuclear-norm
