## Abstract

Matrices of binary or count data are modelled under a unified statistical framework using finite mixtures to group the rows and/or columns. This likelihood-based one-mode and two-mode fuzzy clustering provides maximum likelihood estimation of parameters and the options of using likelihood ratio tests or information criteria for model comparison. Geometric developments focused on pattern detection give likelihood-based analogues of various techniques in multivariate analysis, including multidimensional scaling, association analysis, ordination, correspondence analysis, and the construction of biplots. Illustrative examples demonstrate the effectiveness of these visualisations for identifying patterns of ecological significance (e.g. abrupt versus slow species turnover).

*Keywords:* Association analysis, Biclustering, Biplots, Cluster analysis, Correspondence analysis, Data visualisation, Dimension reduction, Finite mixture, Fuzzy clustering, Multidimensional scaling.

---

## 1. Introduction

There is widespread use of matrices of binary and count data across many disciplines, for example incidence and abundance matrices in ecological communities where the rows are species and the columns are samples, or binary item response analysis with respondents in the rows and questions in the columns. Major objectives include summarising the multivariate
