This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A solution of context integration for a process with data production variability is proposed
- The solution focuses on context integration by either substitution or enhancement
- Both integrations are based on an extension of the model driven architecture approach
- Substitution or enhancement rules conforming to this extended approach are specified
- Modelling and rules coding of both integration cases show automatization feasibility
