This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- This paper, proposes a fuzzy-Pareto dominance driven artificial bee colony (FP-ABC) to solve manyobjective software optimization problem.
- To this contribution, fuzzy-Pareto dominance, quality indicator, Euclidean distance and two external archive concepts incorporated into artificial bee colony (ABC) algorithm.
- The fuzzy-Pareto dominance, quality indicator, Euclidean distance improves the selection process of candidate solution and two external archives concept helps in guiding the algorithm towards better search region.
- The results are compared with the existing many-objective optimization algorithms (i.e., Two-Arch2, NSGA-III, MOEA/D, and IBEA) over seven practical problems.
