This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- In this paper we propose the Activation/Deactivation Prefetcher (ADP).
- ADP improves both performance and energy consumption with respect to the state-of-art HPAC prefetcher.
- Benchmarks exhibit execution phases that can be highly benefited by prefetching, and phases that can be adversely affected.
- Properly handling the memory bandwidth with adaptive prefetchers can help improve performance over aggressive prefetching.
- Further performance and energy gains can be achieved by selectively deactivating/activating individual prefetchers.
