This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Implementation of a distributed attack detection platform, based on machine learning, for IoT applications and cyber-physical systems

Benefits of edge computing capabilities and Extreme Learning Machines for effectively performing traffic classification based on sophisticated models that are pre-built over the cloud.

Deep traffic inspection and classification activities pushed on dedicated edge devices, in order to distribute the processing intelligence near to the data sources.

Shifts the more computationally expensive and storage-demanding operations, associated to classifier training and model construction, to the cloud, leveraging HPC cluster resources
