This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- Address energy and time constrained task scheduling with discrete speed levels
- Prove the NP-hardness even on a uniprocessor computer with only two speed levels
- Develop algorithms with two components: task scheduling and speed determination
- Derive worst-case asymptotic performance bounds and average-case asymptotic performance bounds
- Perform extensive simulations to verify the analytical results
