This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

* We present an accurate and efficient hybrid sound propagation algorithm using a Linkwitz-Riley crossover filter for merging low and high frequency bands that can capture low-frequency wave effects such as diffraction while avoiding the cost of more expensive wave-based simulations.

* Source clustering of nearby sources is used to reduce the optimization search space between 2.5 and 8 times, which is necessary for efficient computations on scenes with a large degree of freedom for placement of sound sources.

* We introduce an efficient discrete optimization method for optimizing source placement that uses impulse response caching to improve convergence, reducing the effective algorithmic complexity of the heuristic optimization algorithm from worst-case $O(m!)$ to $O(m)$.
