Abstract

In this paper, we introduce the notion of infinity branches as well as approaching curves. We present some properties which allow us to obtain an algorithm that compares the behavior of two implicitly defined algebraic plane curves at the infinity. As an important result, we prove that if two plane algebraic curves have the same asymptotic behavior, the Hausdorff distance between them is finite.

1. Introduction

Unirational algebraic varieties, play an important role in the frame of practical applications (see Hoffmann et al. (1997), and Hoschek and Lasser (1993)). In particular, many authors have studied different problems related to plane algebraic curves that are implicitly defined (see e.g. Sendra et al. (2007), and Walker (1950)). In this paper, we deal with the notion of infinity branches which, intuitively speaking, reflect the status of a curve at the points with sufficiently large coordinates. In fact, an infinity branch is associated to
