This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Accurate and automatic organ segmentation from 3D radiological scans is an important yet challenging problem for medical image analysis, especially for small soft organs like the pancreas.
- We present an automated system from 3D computed tomography (CT) volumes that is based on a two-stage cascaded approach – pancreas localization and pancreas segmentation.
- We introduce a fully deep-learning approach, based on an efficient application of holistically-nested convolutional networks (HNNs) on the three orthogonal axial, sagittal, and coronal views.
- Quantitative evaluation is performed on a publicly available dataset of 82 patient CT scans using 4-fold cross-validation (CV). We achieve a (mean std. dev.) Dice similarity coefficient (DSC) of 81.27 6.27% in validation, which significantly outperforms both a previous state-of-the-art method and a preliminary version of this work that report DSCs of 71.80 10.70% and 78.01 8.20%, respectively.
