This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- The study presents a user-behavior-driven augmented content display approach.
- A user behavior perception algorithm, that infers the current state of the user by crosschecking his/her past behavior, is presented.
- Five augmented content display patterns corresponding to the modeled user's behavior states are designed accordingly.
- The experimental results show that iDisplay can accurately infer user states and manage augmented content display efficiently.
