Mariusz Sepczuk received his B.S. degree in 2010 and his M.S. degree in 2011, both in Telecommunication from The Warsaw University of Technology, Poland. He is now PhD student at Warsaw University of Technology, Poland. His research interests are: authentication, Quality of Protection, Quality of Experience and context-aware systems. Moreover, he is interested in penetration tests, malware analysis, Security Information and Event Management, system and network security and cryptography protocols.

Zbigniew Kotulski is a Professor at the Institute of Telecommunications of the Faculty of Electronics and Information Technology, Warsaw University of Technology, Poland. He received his M.Sc. in applied mathematics from the Warsaw University of Technology and Ph.D. and D.Sc. Degrees from the Institute of Fundamental Technological Research of the Polish Academy of Sciences. Zbigniew Kotulski is the author and co-author of 5 books and over 200 research papers on applied probability, cryptographic protocols and network security.

Abstract

With the increasing role of numerous Internet services, more and more private data must be protected. One of the mechanisms which is used to ensure data security is user authentication. A reliable authentication mechanism is a foundation of security of a remote service but, on the other hand, it is also a source of user frustration because of fear of losing access in case of three failures. A remedy to this problem could be contextual secure authentication. Such a protocol should provide multi-level authentication mechanism which increases user satisfaction without decreasing a protection level. In this paper we propose a risk analysis procedure of a new
