This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Secure bimodal PIN-entry method using audio signals

Mun-Kyu Lee received the B.S. and M.S. degrees in computer engineering, and the Ph.D. degree in electrical engineering and computer science from Seoul National University, in 1996, 1998, and 2003, respectively. From 2003 to 2005, he was a Senior Engineer with the Electronics and Telecommunications Research Institute, Korea. He is currently an Associate Professor with the Department of Computer and Information Engineering, Inha University, Korea. His current research interests include information security and theory of computation.

Hyeonjin Nam is an undergraduate student in the Department of Computer and Information Engineering, Inha University, Korea. Her current research interests are in the areas of information security and mobile computing.

Dong Kyue Kim received the B.S., M.S. and Ph.D. degrees in Computer Engineering from Seoul National University in 1992, 1994, and 1999, respectively. From 1999 to 2005, he was an assistant professor in the Division of Computer Science and Engineering at Pusan National University. He is currently a professor in the Division of Electronics and Communications Engineering at Hanyang University, Korea. His research interests are in the areas of embedded security systems, crypto-coprocessors, information security, and hardware implementation for cryptographic devices. He is now a board member of IEEE Seoul Section, and a director of KIISC, KIPS, and KMMS.

Abstract

A Personal Identification Number (PIN) is a multiple-digit sequence widely used for user authentication. It is desirable for a PIN-entry method to be secure against two main security threats, random guessing attacks and recording attacks. Although there have been many proposals for challenge-response-based PIN-entry methods, it is well known that the only way to prevent both attacks is to physically prevent attackers from observing the challenge-response pairs, which motivates the development of PIN-entry methods that use secure secondary channels such as audio signals. To provide a guideline for designing an audio-based PIN-entry method, we propose a simple framework to transform a non-audio-based method into an audio-based one. We also present a new PIN-entry method that improves the performance of this simple transformation. Most audio-based methods in the literature are unimodal methods, that is, they transmit almost all required information through an audio channel because it was believed that this approach maximized the user's performance. In this paper, however, we show that a carefully designed bimodal system may be more usable than a unimodal one. We present a new PIN-entry method whose audio channel only transmits the minimal required data while most of the challenge information is transmitted through the efficient visual channel. Our user study shows that the PIN-entry time of the proposed method is shorter than those of the previous audio-based methods, while its error rate is kept as low as that of the previous methods.

Keywords: user authentication, personal identification number (PIN), usability, shoulder
