### ABSTRACT

Enterprise (large organisation) computing workloads are moving from ‘on-prem’ to ‘in-cloud’ increasingly quickly, and the cloud is forecast to account for almost half of enterprise IT by 2026, up from 10% today. But the benefits of the enterprise cloud need to be weighed against increasingly burdensome duties around cloud and data security. This comment piece provides a checklist of the sources of enterprise cloud security duties and a checklist of best practices to manage them.

After the demanding bow wave of GDPR readiness legal work in the run up to 25 May 2018, IT lawyers may be forgiven for thinking that the biggest change is now behind them. However, GDPR heralds rather than ends a period of broadly based structural change in technology adoption, business transformation and IT law and regulation. Nowhere is this better shown than in the legal aspects of the rapidly developing area of cloud security.

A central feature of this change is the epic migration now well underway in enterprise (large organisation) computing from ‘on premise’ – traditional IT infrastructure at the user – to ‘in-cloud’ – open access to the public cloud, the more dedicated resources of the private cloud and their hybrid cloud combination. The development of the enterprise cloud is as significant as the migration of electricity generation out of the factory to the UK national grid in the 1930s but with many more facets, as each component of computing – power, processing, network, memory, storage and software – gets the cloud’s ‘as a service’ treatment.

Aggregating the elements of the private cloud and Infrastructure (IaaS), Platform (PaaS) and Software (SaaS) in the public cloud, and comparing their projected development over the next ten years with ‘traditional’ enterprise computing, open source IT research organisation Wikibon is forecasting that the cloud’s share of enterprise computing will grow from around 10% today to 45% by 2026.<sup>1</sup>

For enterprise users, the cloud provides a range of benefits and opportunities, including provisioning flexibility, access to new services, assisting digital transformation, speed of deployment and cost efficiencies. However, enterprise-scale organisations operate in a business environment that increasingly emphasises the criticality of cloud and data security – the legal, technical, operational and governance controls that an organisation puts in place to ensure desired information security outcomes.

As IT workloads migrate to the cloud, the benefits of cloud provisioning need to be weighed and balanced against security risks and duties. Organisations are therefore establishing cloud security and compliance governance procedures
