This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

#### ACCEPTED MANUSCRIPT

## **Highlights**

- Proposed scheme segments out suspicious lesions from digital mammograms automatically using adaptive fuzzy region growing method
- Proposed segmentation scheme incorporates a novel neighboring pixel selection algorithm which reduces computational complexity.
- The segmentation results showed 91.67% sensitivity and 58.33% specificity.
- k-NN and SVM classifiers with radiomic features such as geometric and textural features improves specificity upto 91.67% with False Positives per Image of 0.55 only.
- The radiologists involved in the study have appreciated the potential of the proposed scheme and hence it can be used in a CAD system to assist them in clinical breast cancer diagnosis.
