This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Our predictive models applying machine learning methods were able to identify non-participants more precisely than heuristic method.
- The present study revealed the important variables for prediction of participation in general health check-up.
- The knowledge added by the present study will improve appropriate targeting of non-participants.
