This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**HIGHLIGHTS**

- Spiral waves can be clustered using localized electrogram readings obtained with most commonly used multipolar diagnostic catheters
- Normalized compression distance (NCD) is shown to be a powerful and robust tool in discrimination of distinct properties manifested on a set of EGMs without a need to extract features.
- Compressibility of electrogram dataset is found to be more informative in segregation of spiral wave behaviors than spectral parameter of it.
