This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- Smartphones have the potential to accomplish balance assessment with their built-in sensors, however, the feasibility is needed to be proved.
- Smartphone-based assessment method can differentiate the balance performance of healthy adults and subjects with stroke.
- Smartphones may be a convenient, easy-to-use, and valid tool for the balance assessment in subjects with chronic stroke.
