This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

HIGHLIGHTS

- In this paper we presented an approach for automatic tissue segmentation using a Convolutional Neural Network. The methodology is based on the classification of different tissue types: Necrotic, granulation and slough.
- We present different metrics to evaluate our approach, obtaining an overall average classification accuracy of 92.01%, an average total weighted Dice Similarity Coefficient of 91.38%, and an average precision per class of 97.31% for granulation tissue, 96.59% for necrotic tissue, and 77.90% for slough tissue.
- By using this methodology, we were able segment complicated structures within the image to be recognized, providing a robust method for Pressure Injuries assess.
