This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- We tackle the bi-objective single p-batching machine problem of minimizing maximum lateness and number of jobs with a restricted batch size.
- We applied an epsilon-constraint method and develop new mathematical models that are enhanced with a family of valid inequalities and constraints that avoid symmetric solutions.
- We find Pareto-optimal solutions in reasonable times for up to 50 jobs.
- We develop a BRKGA for larger instances of up to 100 jobs with good results with smaller computational times than the exact methods.
