This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We present two algorithms for the Cyclic Bottleneck Assignment Problem (CBAP), which is an NP-hard problem.
- We compare our algorithms with the available metaheuristic methods and commercial solver CPLEX.
- Our algorithms outperform the existing methods and CPLEX
- The tabu search approach works slightly better than the iterated local search method.
