This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We consider a parallel machine scheduling with time-dependent deterioration and multiple rate-modifying activities.
- The deterioration is a linear function of a gap between starting time of job and the ending time of the previous RMA.
- We developed a mixed integer programming model for the problem to find the optimal solution.
- A novel simulated annealing algorithm embedding a mathematical model with an adjustment heuristic is effective and efficient for solving the problem.
