This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We propose a new branch-cut-and-price algorithm for heterogeneous vehicle routing.
- The same algorithm can also solve multi-depot and site-dependent vehicle routing.
- Techniques from previous works are combined and improved.
- Experiments show that many instances with 200 customers can now be solved.
- A new set of 100 benchmark instances is proposed
