Iterative Ranking Aggregation Using Quality Improvement of Subgroup Ranking

Jiankun Ding, Deqiang Han, Yi Yang

PII: S0377-2217(18)30067-5
DOI: [10.1016/j.ejor.2018.01.031](https://doi.org/10.1016/j.ejor.2018.01.031)
Reference: EOR 14932

To appear in: *European Journal of Operational Research*

Received date: 10 September 2016
Revised date: 9 January 2018
Accepted date: 15 January 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The ranking aggregation is realized by improving the subgroup rankings quality.
- The average ranking distance criterion is used to evaluate the ranking aggregation.
- The new approach can improve the quality of the heuristic ranking aggregation.
- There is a tradeoff between the optimality and computational cost.
