This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We develop a scenario model to support the selection of strategic actions
- The model admits incomplete and action-dependent scenario probability information
- Decision recommendations are based on dominance relations between action portfolios
- Non-dominated portfolios can be used to derive action-specific recommendations
- The model is applied to a real case for building a strategy for a platform ecosystem
