This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We propose a parallel policy for autonomous tier-captive storage/retrieval systems.
- A fork-join queueing network is formulated to analyze the system performance.
- The parallel policy has advantages in small size systems.
- The parallel policy has advantages below a critical transaction arrival rate.
