This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We tackle the difficult port-of-entry inspection problem by adding coherency
- A decision-based logical model is defined under realistic assumptions
- We develop a simple yet widely applicable algorithm for real sequential inspections
- Combination of binary decision trees and minimization of boolean functions
- The efficiency and flexibility of the algorithm is measured against real data
