This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We present a student-centric ETP with improve exam spread by dynamically allowing more versions of exams.
- We propose two column generation algorithms to solve exam-timetabling problems.
- Both models include dynamic spreading of exams by using spreading costs.
- Second model has post-processing: either by heuristic or integer program(IP).
- Model 2 performs marginally better than Model 1, but is less scalable.
- Student spreading costs for existing data sets were improved at the cost of more exam versions.
